

# CYBERSECURITY FOUNDATIONS & NETWORKING LAB NOTES

**Prepared by:** Chennari Mohammed Idris

**Date:** February 21, 2026

**Project:** Task 1 - Foundation & Environment Setup

## 1. The Core: CIA Triad

The foundation of all security policies I implemented in this lab is the **CIA Triad**:

- **Confidentiality:** Ensuring data is only accessible to authorized users.
  - *Applied:* Used a **Host-Only Adapter** to keep lab traffic invisible to the outside world.
- **Integrity:** Guaranteeing that data has not been altered or tampered with.
  - *Applied:* Verified connectivity using ping and monitored packet health via **Wireshark**.
- **Availability:** Ensuring systems and data are accessible when needed.
  - *Applied:* Configured static environments to prevent downtime during testing.

## 2. Threat Landscape & Attack Vectors

Understanding what we are defending against is crucial.

- **Common Threats:** \* *Phishing/Social Engineering:* Deceiving users to gain access.
  - *Malware/Ransomware:* Malicious software designed to disrupt or lock systems.
  - *DDoS:* Overwhelming a service to break its **Availability**.
- **Vectors:** I learned that an **Insider Threat** (someone already inside the network) can be just as dangerous as an external hacker using a **Wireless Attack**.

## 3. Networking & The OSI Model

- To analyze the "Ping" test in Wireshark, I mapped the data flow across the **OSI Model**:

Layer	Name	Function	Protocol Example
7	Application	User Interface	HTTP, DNS, SMTP
4	Transport	End-to-End Connection	<b>TCP</b> (Reliable), <b>UDP</b> (Fast)

Layer	Name	Function	Protocol Example
3	Network	Routing & Logical Addressing	IP, ICMP (Ping)
2	Data Link	Physical Addressing	MAC Address, Ethernet

## 4. Cryptography Basics

I explored how we protect data at rest and in transit:

- **Encryption:** \* *Symmetric*: Same key for lock/unlock (Fast).
  - *Asymmetric*: Public key to lock, Private key to unlock (Secure).
- **Hashing**: A "one-way" fingerprint (MD5/SHA256) used to verify **Integrity**. Unlike encryption, a hash cannot be reversed.
- **Digital Certificates**: Used in **SSL/TLS** to prove a website's identity (the "S" in HTTPS).

## HANDS-ON “ENCRYPT AND DECRYPT USING OPENSSL”:

**Objective:** To demonstrate the practical application of symmetric encryption and decryption to ensure data Confidentiality.

### 1. File Creation

I created a plaintext file containing sensitive information to be protected.

- **Command**: echo "this is a secret message" > secret.txt

### 2. Symmetric Encryption (AES-256)

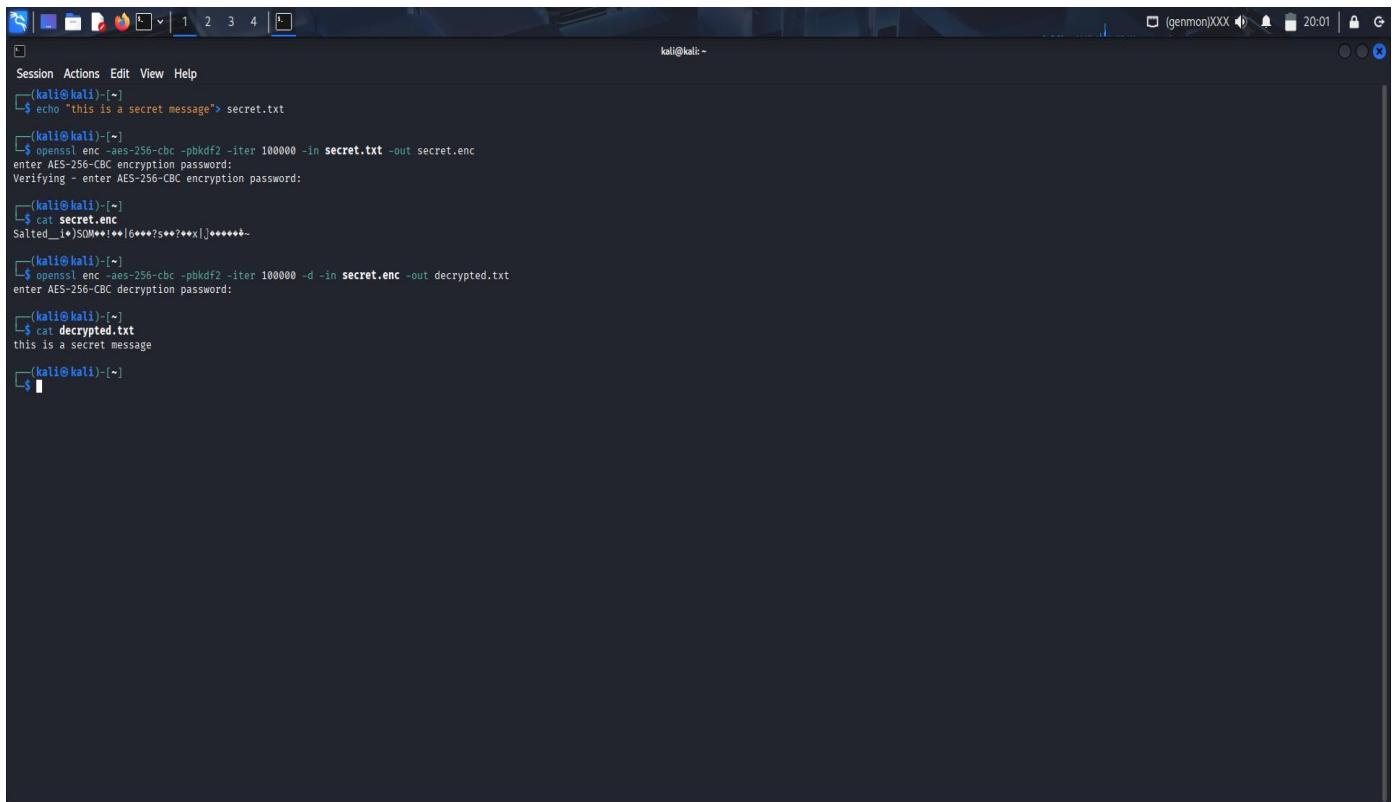

I used the Advanced Encryption Standard (AES) with a 256-bit key to encrypt the file. I applied the PBKDF2 (Password-Based Key Derivation Function 2) to ensure the password was securely hashed before being used as a key.

- **Command**: openssl enc -aes-256-cbc -pbkdf2 -iter 100000 -in secret.txt -out secret.enc
- **Observation**: After encryption, attempting to read the file using cat secret.enc resulted in unreadable ciphertext (gibberish). This confirms that the data is protected.

### 3. Decryption and Verification

To regain access to the data, I used the decryption flag with the original password.

- **Command**: openssl enc -aes-256-cbc -pbkdf2 -iter 100000 -d -in secret.enc -out recovered.txt
- **Result**: The command cat recovered.txt displayed the original message perfectly, confirming the integrity of the encryption/decryption process.

A screenshot of a terminal window titled "kali@kali: ~". The terminal displays a sequence of OpenSSL commands used for encrypting and decrypting a file named "secret.txt".

```
Session Actions Edit View Help
(kali㉿kali)-[~]
$ echo "this is a secret message" > secret.txt
(kali㉿kali)-[~]
$ openssl enc -aes-256-cbc -pbkdf2 -iter 100000 -in secret.txt -out secret.enc
enter AES-256-CBC encryption password:
Verifying - enter AES-256-CBC encryption password:
(kali㉿kali)-[~]
$ cat secret.enc
Salted__6*****S*****x[]*****-
(kali㉿kali)-[~]
$ openssl enc -aes-256-cbc -pbkdf2 -iter 100000 -d -in secret.enc -out decrypted.txt
enter AES-256-CBC decryption password:
(kali㉿kali)-[~]
$ cat decrypted.txt
this is a secret message
(kali㉿kali)-[~]
$
```
